Normal reservoir pressure is the pressure in the reservoir fluids necessary to sustain a column of water to the surface. Normal pressures range between 0.43 and 0.50 psi/ft. Normal drilling muds weigh about 9 ppg (pounds per gallon) and exert a bottom hole pressure of approximately 0.47 psi/ft of depth.

WELL CONTROL MANUAL 9 than the formation pressure and may cause a well kick. There are various geological reasons for abnormal pressures. 2.0.4. Insufficient mud density If a formation is drilled using a mud density that exerts less hydrostatic pressure than the pore pressure, the formation fluid may begin to flow into the well bore.

Reservoir pore fluid pressure that is not similar to normal saltwater gradient pressure. The term is usually associated with higher than normal pressure, increased complexity for the well designer and an increased risk of well control problems.Pressure gradients in excess of around 10 pounds per gallon equivalent fluid density (0.52 psi/foot of depth) are considered abnormal.

Home: How abnormal pressures affect hydrocarbon exploration, exploitation. Abnormal pressures, principally overpressure but also underpressure, have been discussed in numerous papers.

How abnormal pressures affect hydrocarbon exploration ...

When drilling ahead and using consistent drilling parameters, as the bit wears, a normal trend of decrease penetration rate should occur. If the differential pressure between the hydrostatic pressure of the drilling fluid and formation pore pressure decreases, an increase in the drilling rate occurs as the chip hold down effect is reduced.
