Transmitter design. All wireless transmitters have four common building blocks: transmitter coils and resonance capacitors, a full or half-bridge inverter, a modulator/demodulator handling communication packets, and circuits that sense power transfer and protect against conditions arising from factors such as foreign objects in the resonance field.

In this article, I'll show you how to built a Wireless Transfer of Energy Transmitter. Simply put, this device will send electricity to a florescent light bulb and light it up, from up to three feet. The idea originally (at least, prominently) came from Nikola Tesla (read more about this amazing inventor here), who used his Tesla coils to transfer wireless energy to light bulbs in ...

How to Build a Wireless Energy Transfer Array to Power ...

In my research I found, that to transfer power in very complicated. Once i did it I found that you do not need to go to MIT do do this sort of stuff. With a little electrical know how, this is easy. It all starts with the transmitter. This transmitter needs to create 147.7 kHz square wave AC signal. Let me take a minute to explain this all.

Wireless Power : 9 Steps (with Pictures) - Instructables

Metallic medium is a big "NO" for wireless power medium (between transmitter and receiver) because it won't let the power pass through and absorbed most energy and generate heat. This is applicable only for inductive based wireless power transmission.
