Design for manufacturability (also sometimes known as design for manufacturing or DFM) is the general engineering practice of designing products in such a way that they are easy to manufacture. The concept exists in almost all engineering disciplines, but the implementation differs widely depending on the manufacturing technology.

Design for manufacturability - Wikipedia

Design for Manufacturing (DFM) is the process of designing parts, components or products for ease of manufacturing with an end goal of making a better product at a lower cost. This is done by simplifying, optimizing and refining the product design. The acronym DFMA (Design for Manufacturing and Assembly) is sometimes used interchangeably with DFM.

What is Design for Manufacturing or DFM?

Volume also plays an important role in determining manufacturability. For CNC machining, the law of diminishing returns kicks in around volumes of 100-300 parts, depending on the application. Material type constitutes another significant factor, since parts made from softer metals—such as aluminum or brass—will also be easier to machine.

Designing the perfect part and assembly is an ultimate goal, however a design through manufacturing business environment that fails to execute optimally can be much more costly. DFA is generally more cost effective than DFM (individual parts) in high volume applications though low volume end-items can and do benefit.

Why DFM/DFA is Business Critical - Engineers Edge

Minimizing part counts for a single product or family can do wonders for manufacturing and is therefore a critical part of design for manufacturability. When you use fewer unique parts in a product you dramatically increase individual part volumes. Manufacturing Costs Linked To Part Volume. Individual part costs are closely linked to volumes.

Abstract: Design for Manufacturability (DfM) improves semiconductor integrated circuit (IC) yield by optimizing product design or layout. Positive impact of DfM on yield can be realized at production time (e.g., parametric yield), at the end of production (e.g., functional yield), or in the field (e.g., reliability yield).
